November 19, 2015

## Public Opinion: Practicum

### Questions:

- Is public opinion on civil rights issues associated with Supreme Court justices' votes?
- Does that association hold even after controlling for justices' ideological views?
- Is that association stronger among moderate justices, or among more ideologically extreme ones?
- Has the strength of that association changed over time?

## Mood and Votes: Justice-Specific Correlations

## Mood and Votes: Correlations By Term

### Some Conclusions

### Answers:

- There is a weak negative correlation between public mood on civil rights issues and the justices votes in cases involving civil rights claims.
- Once we hold constant / control for justices' ideologies, the relationship between public opinion and judicial voting becomes positive, but is still very small.
- While the patterns are not strong, it appears that more ideologically extreme justices are more likely to show a high correlation between public opinion and voting than are more moderate ones.
- In recent years, there appears to be a slight upward pattern in the association between justices' votes and public opinion, though once again the pattern is not very strong.
